Professional Summary:

Full Stack Developer with 6+ years of experience leading critical technical migrations, accessibility remediations (WCAG), and architecture modernization across e-commerce, real estate, and design platforms. I work primarily with JavaScript (Node.js, Vue) and Laravel, executing projects from planning through production maintenance, with a focus on solutions that deliver measurable impact on cost, stability, and user experience.

Professional Experience:

Featured Projects

Fullstack Developer – Proyectos Luccitti C.A, Venezuela - Remote

Technologies used: AngularJS 1.5, Laravel, Vue, Google Maps API

- Prevented the loss of a key client by leading a full accessibility remediation of a real estate platform to meet U.S. WCAG standards — a non-negotiable contractual requirement to continue the collaboration. Implemented VoiceOver support, full keyboard/Tab navigation across plugin-generated views, and fixed all color contrast issues sitewide.
- Optimized a centralized PHP plugin for custom XML structure generation, achieving immediate integration with Homescom across the portfolio's active projects without the need for individual platform-specific development.
- Migrated the Google Maps API across 20+ active projects (Vue 2, Vue 3, AngularJS) ahead of the legacy version's deprecation, with no disruption to geolocation services for end users.

Full Time Jobs

Fullstack Developer – Thefutures.io, UK - Remote - Fulltime (Mar 2021 – Act.)

Technologies used: Vue 2, Vue 3, Laravel, OpenAI, Forge, Vuex, Vue Router, Pinia, Inertia, Nuxt.js

- Replaced Survey.js (a ~\$200 USD/month subscription) with a custom dynamic forms engine built in Vue, eliminating the recurring cost, reducing bundle size, and enabling unlimited future customization.
- Implemented server-side caching with Redis, reducing store load times and improving perceived speed for users.
- Achieved a 5% boost in build performance by resolving a Laravel Mix configuration bottleneck. By decoupling SCSS compilation and enabling Blade-level CSS caching, I successfully removed redundant compilation overhead for Vue-integrated components.
- Designed an abstraction for the one-time purchase system, standardizing the flow across different product types so none would fall out of sync when business model changes were introduced.
- Applied design patterns (Repository and Decorator) to Laravel controllers, reducing lines of code in the affected files and centralizing business logic to improve maintainability and extensibility.
- Implemented structured typing via classes for core business entities (User, Store, Community, Course), decoupling business logic from Vue components. Result: 10% smaller components and removal of complex mixin dependencies.
- Built CRUD functionality in the users microservice to support an exclusive content module, decoupling that logic from the main monolith.

Laravel Developer – Vivetix, Spain - remote - Fulltime (May 2020 – May 2021)

Technologies used: Laravel, Jquery, Bootstrap, React

- Built a RESTful API for event management and payment method configuration, with decoupled logic that enabled direct consumption from the web client and immediate integration by external teams.

- Automated file verification and compression on upload using the iLovePDF Developers API, cutting client communication time by 50% by removing the need for manual technical support.
- Developed the controllers and service architecture for sales and revenue metrics calculation, integrating the Google Analytics API to give dashboard users clear financial visibility.
- Led the migration from Bootstrap v3.3 to v5.0 across the Dashboard, Forum, Payment Methods, and White Branch modules, modernizing the interface in the platform's critical components.

Skills & Technologies:

Principal Stacks:

- Frontend: Vue, AngularJS, Typescript, Vuetify, Pinia, Vuex, Vue Router, Bootstrap, Nuxt.js
- Backend: Laravel, Node.js, Express.js,
- Data Base: MySQL, Redis.
- Work flow: Git, Nginx, Laravel Forge, AWS, Jira, Confluence, Slack, Trello, Scrum/Agile

Secondary Stacks:

- Frontend: React.js
- Data Base: PostgreSQL

Education:

- **Beginner Path of Vue 2 y Vue 3** – [Vuemastery] (2026)
